

I'm not robot

**Continue**

ROPOS works out of a cage that acts as a garage for the vehicle while it is being lowered to the bottom or brought back to the surface (box fig. 1). The fiber-optic tether that connects the cage to the ship is also used to transmit images from cameras on ROPOS and other data, including plotting commands, to the vehicle. After the cage is lowered to the bottom, where it is moved to the first target, the inactive black smoker called Phleg. Its initial task was to take pictures of this structure to document its characteristics for before-and-after studies. It then cinched cables around the smoker using a recovery cage that had been specially designed to fit over it. The next step was for ROPOS to approach the smoker and cut into its base using a chain saw with carbide and diamond-embedded Phleg in the chain (box fig. 2). After a series of cuts had been made, ROPOS was backed away from the chimney. The recovery cage and cables were attached to a line brought over by ROPOS from a previously deployed recovery basket on the bottom holding 2400 m (8000 ft) of line. ROPOS was then brought on deck, and the recovery line was floated to the surface, where it was brought onboard the Canadian Coast Guard's vessel John P. Tully and attached to a winch. The Tully then took up slack on the line, broke the smoker off its base, and brought it to the surface (box fig. 3), where the structure was cut in half in preparation for geologic and microbiological studies. This process was repeated three times during the course of the expedition to recover a total of four sulfide chimneys (box fig. 4). The sulfide edifices were chosen in part for their diversity. Phang, the 73 Box Figure 1 The Canadian ROPOS (Remotely Operated Platform for Ocean Science) in its deployment cage. Box Figure 2 With the recovery cage in place, ROPOS approaches the base of the chimney in preparation for cutting with a carbide and diamond-embedded chain saw. Box Figure 3 A sulfide chimney breaking the surface during recovery, with the recovery cage surrounding it. dead chimney, did not have any water flowing through it, but another chimney, Finn, was very active, with 304°C (579°F) hydro thermal fluid flowing out. Neither chimney had many large organisms attached. The remaining two chimneys recovered, Roane and Gwenen, were venting fluids at temperatures of 20° to 200°C (68° to 392°F) and had diverse communities of organisms living on them. The chimney recovered in 1.5 m (5 ft) tall and weighs 1800 kg (4000 lb). It is now on display at the American Museum of Natural History in New York City. The smokers will be studied in detail by geologists, biologists, and chemists to learn more about the extreme chemical and thermal gradients that characterize these environments, the conditions under which sulfide structures grow and evolve, and how nutrients may be delivered to the organisms that live on and within the structures. Such studies are likely to find new species of microorganisms that thrive in these high-temperature, sunlight-free environments. Preliminary studies on these samples indicate that microorganisms living within the structures at temperatures of 90°C (194°F) derive their energy from carbon-bearing species in the hydrothermal fluids and from mineral-fluid reactions within the rocks. These and similar findings are exciting in that they show that microorganisms are capable of living in the absence of sunlight in volcanically active water-saturated regions of our planet. Other hydrothermally active planets may harbor similar life forms. (a) Box Figure 5 Tube worm colony attached to one of the recovered chimneys. (b) Box Figure 4 (a) Several segments of recovered chimneys secured on deck. (b) Section of a chimney that was cut in half for study of its interior. 73 74 Chapter 2 Earth Structure and Plate Tectonics (a) Age = 0 (b) Age = 10 Ma (c) Age = 30 Ma (d) Age = 100 Ma (e) Age = 300
